- The Neutrino Factory
 - The nufact study group
- The beta beam
 - The BENE beta-beam working group

CNGS

In Dec. 1999, CERN council approved the CNGS project:

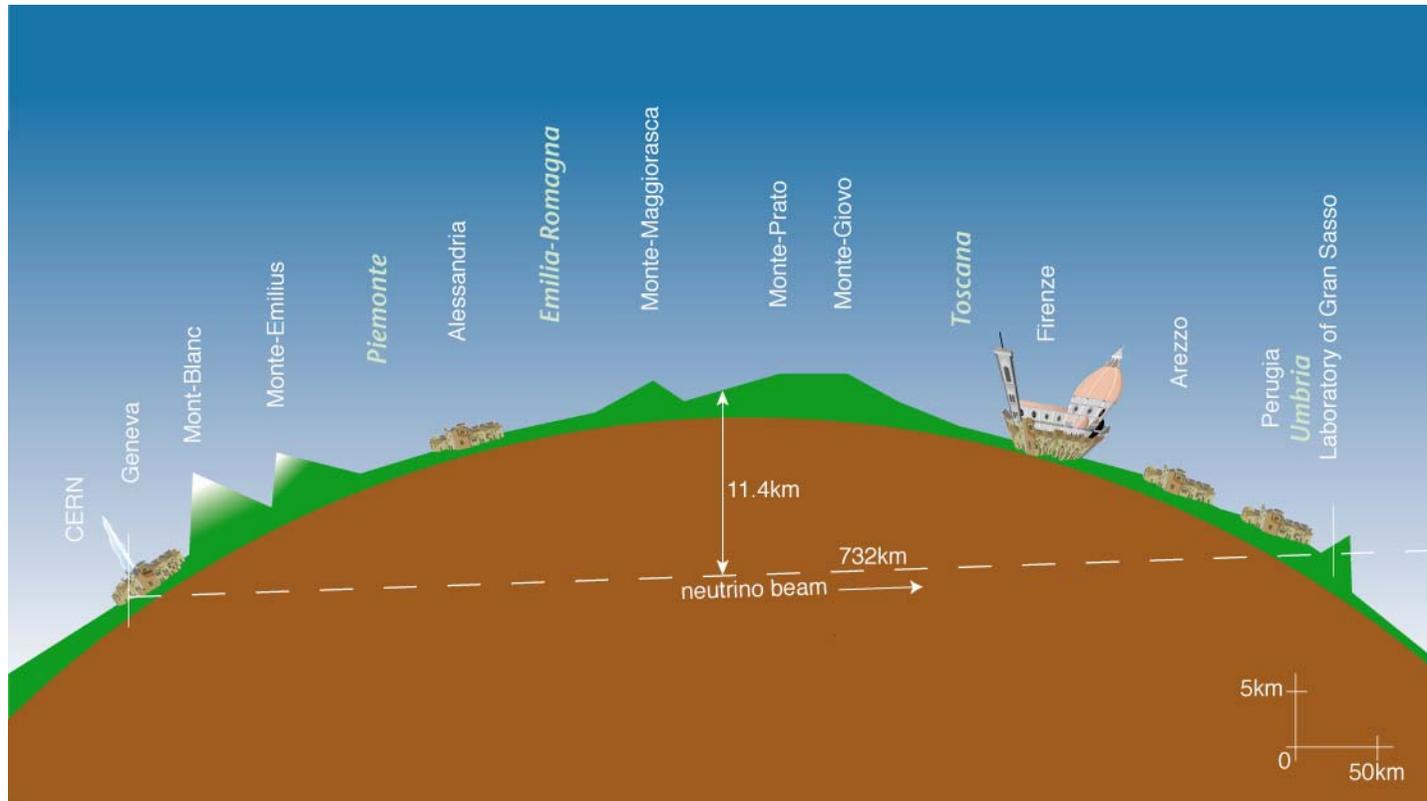

- build an intense ν_μ beam at CERN-SPS
- search for ν_τ appearance at Gran Sasso laboratory (730 km from CERN)

"long base-line" ν_μ -- ν_τ oscillation experiment

note: K2K (Japan) running; NuMI/MINOS (US) under construction

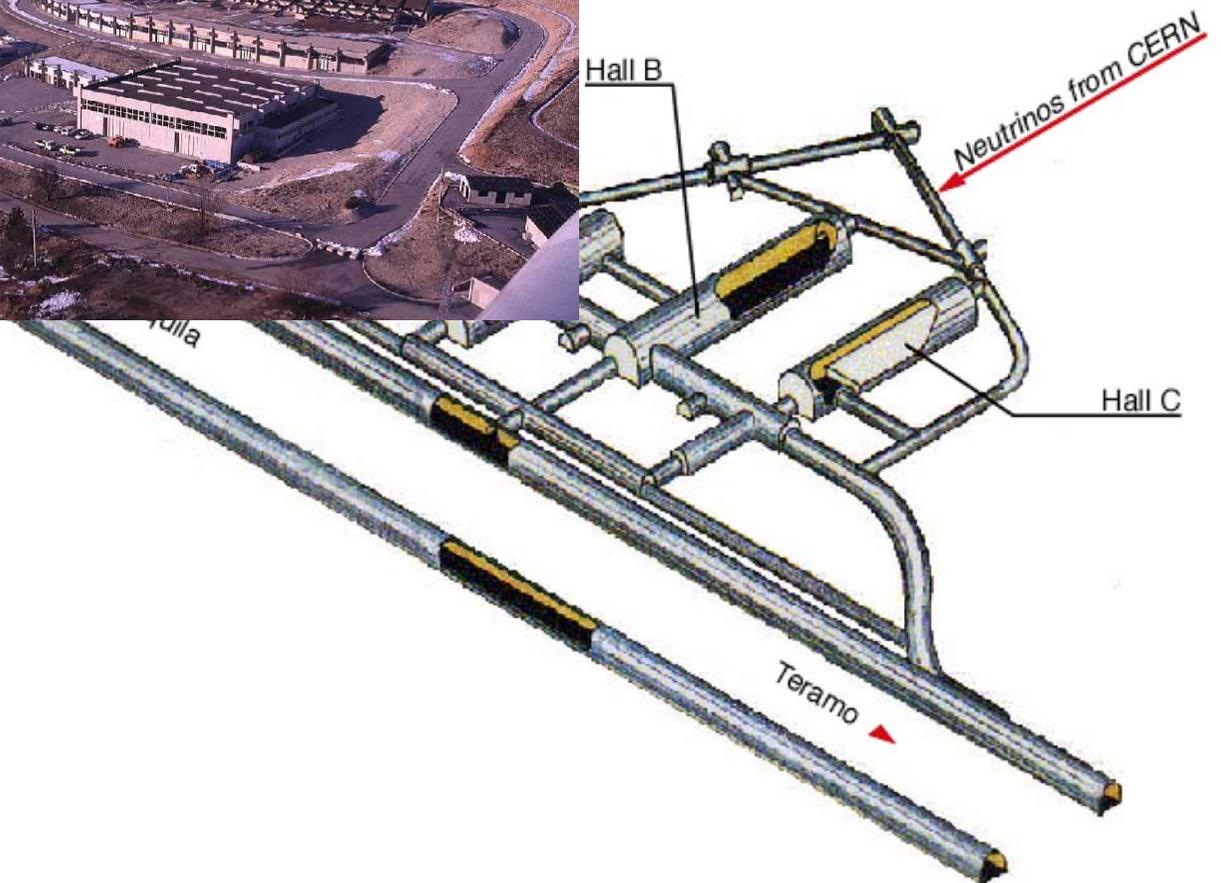

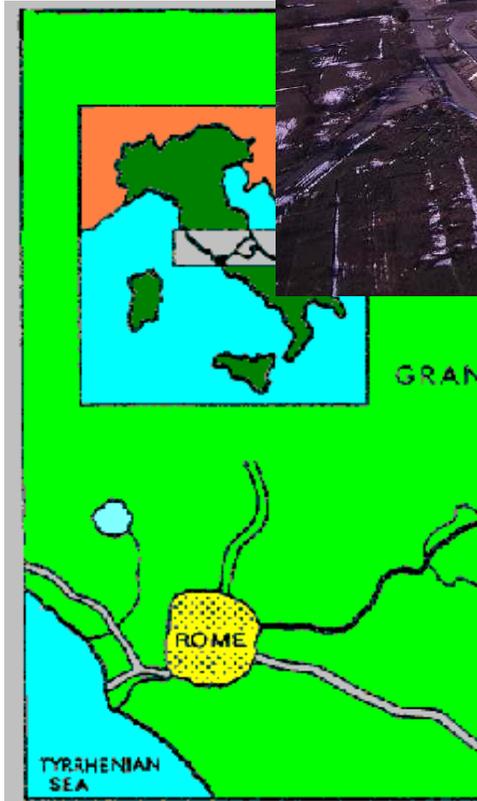

CERN to CNGS

ECT* meeting

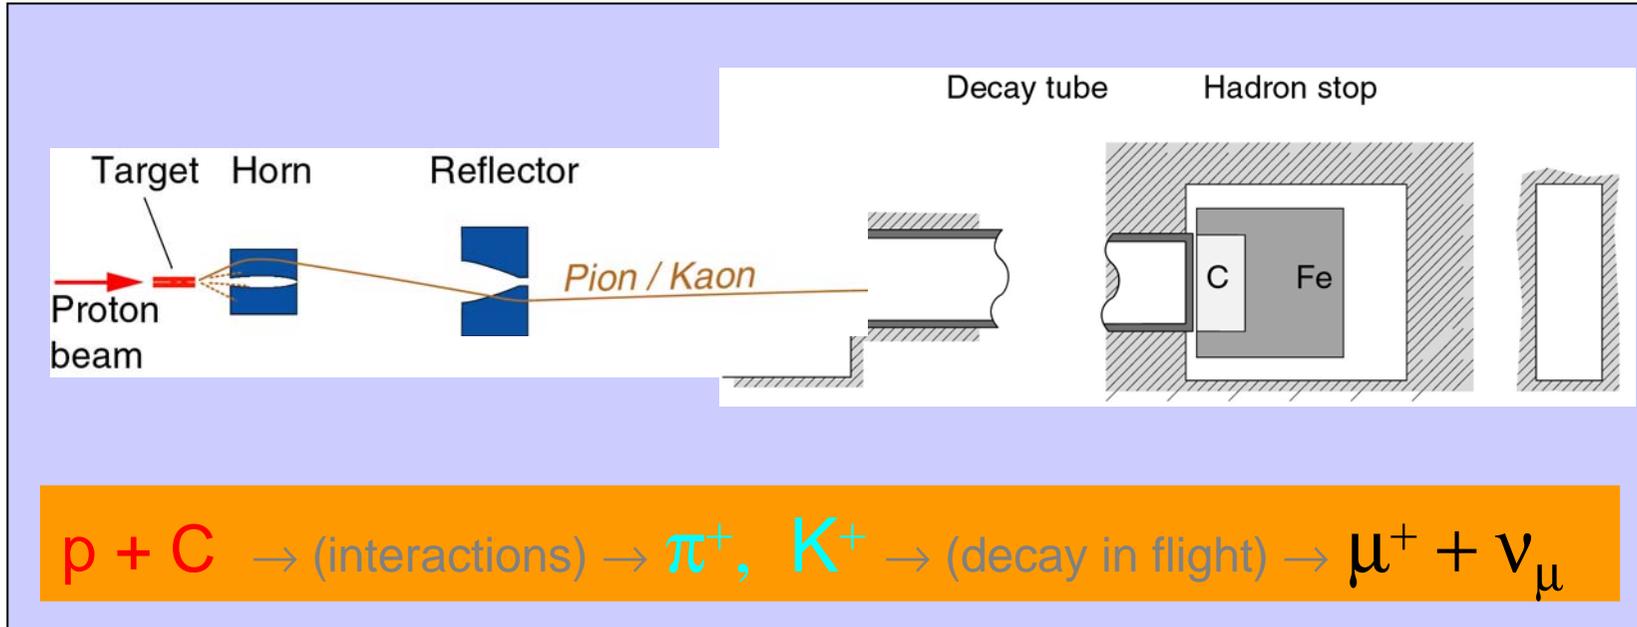

The Gran Sasso laboratory

The CERN part

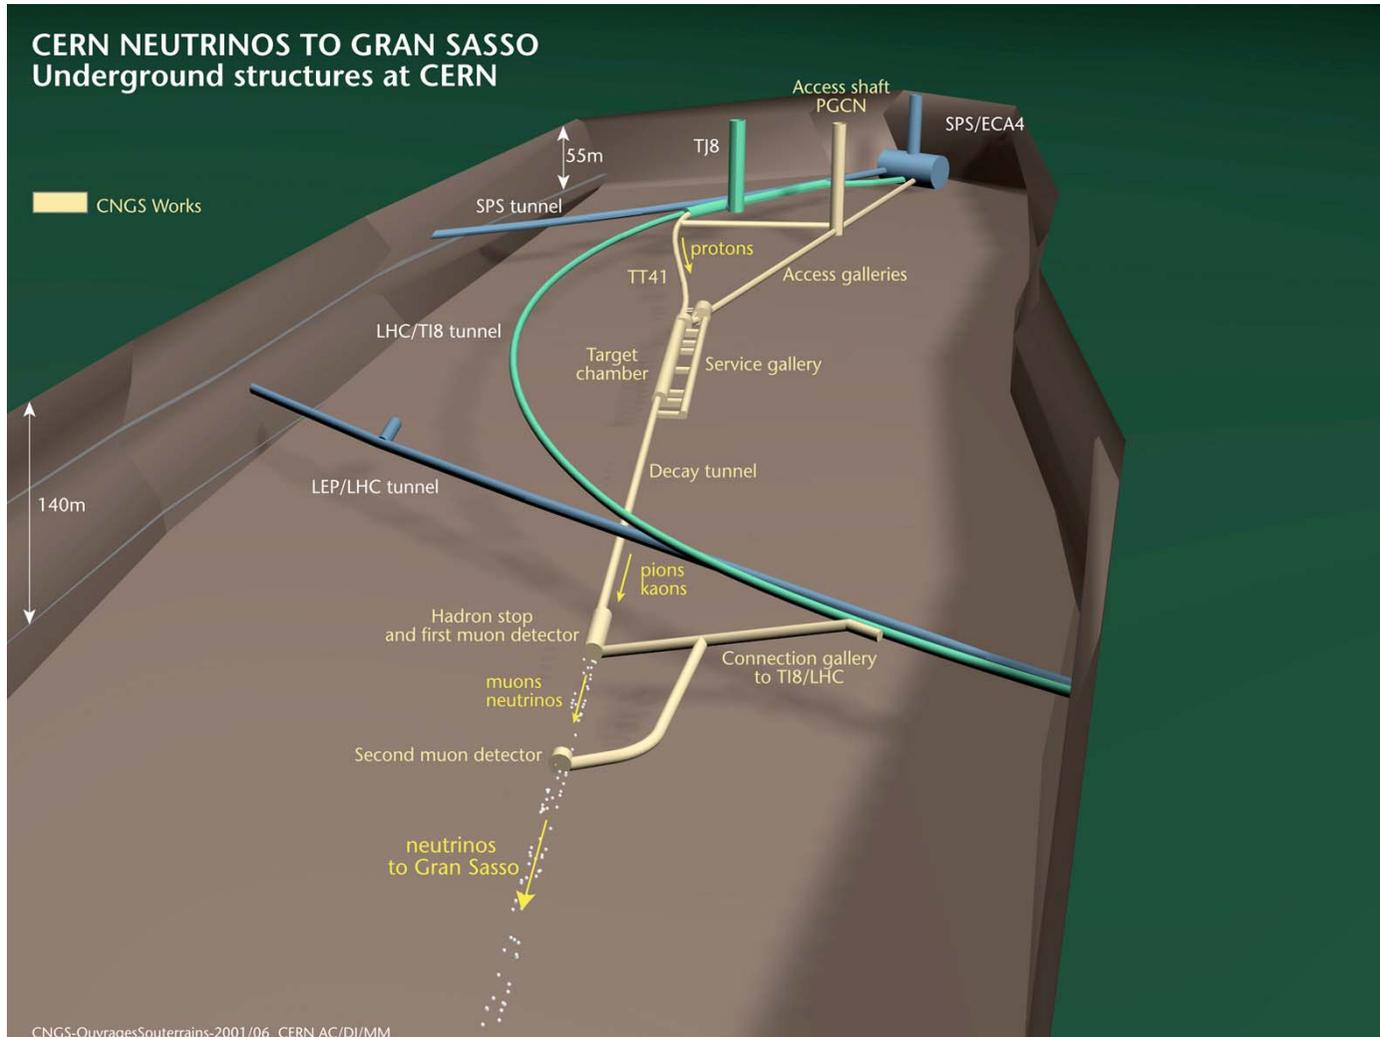

Polarity change foreseen!

...but the intensity will go down and the contamination goes up

CERN underground

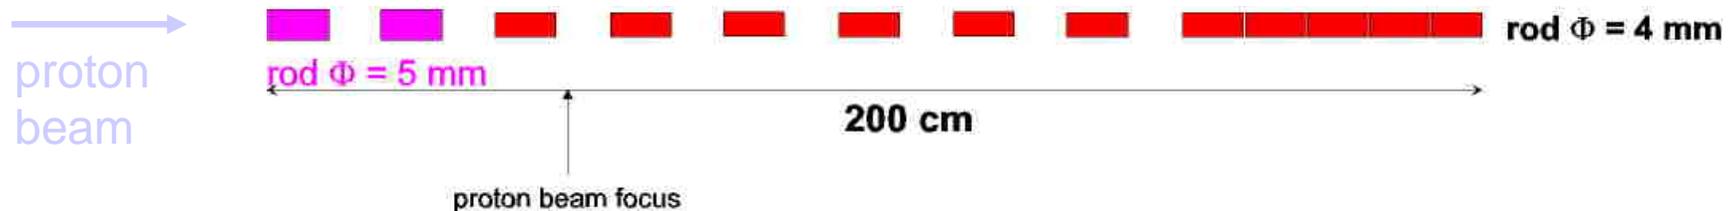

ECT* meeting

CNGS target

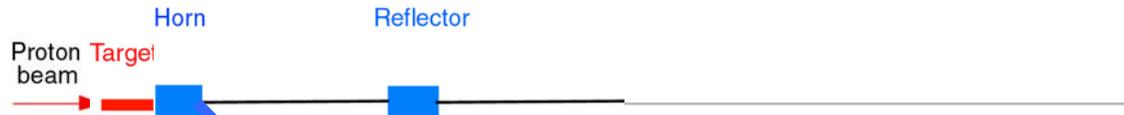

-> 10 cm long graphite rods, $\varnothing = 5\text{mm}$ and/or 4mm

- Note:**
- target rods interspaced to "let the pions out"
 - target is helium cooled
(remove heat deposited by the particles)

CNGS focusing devices

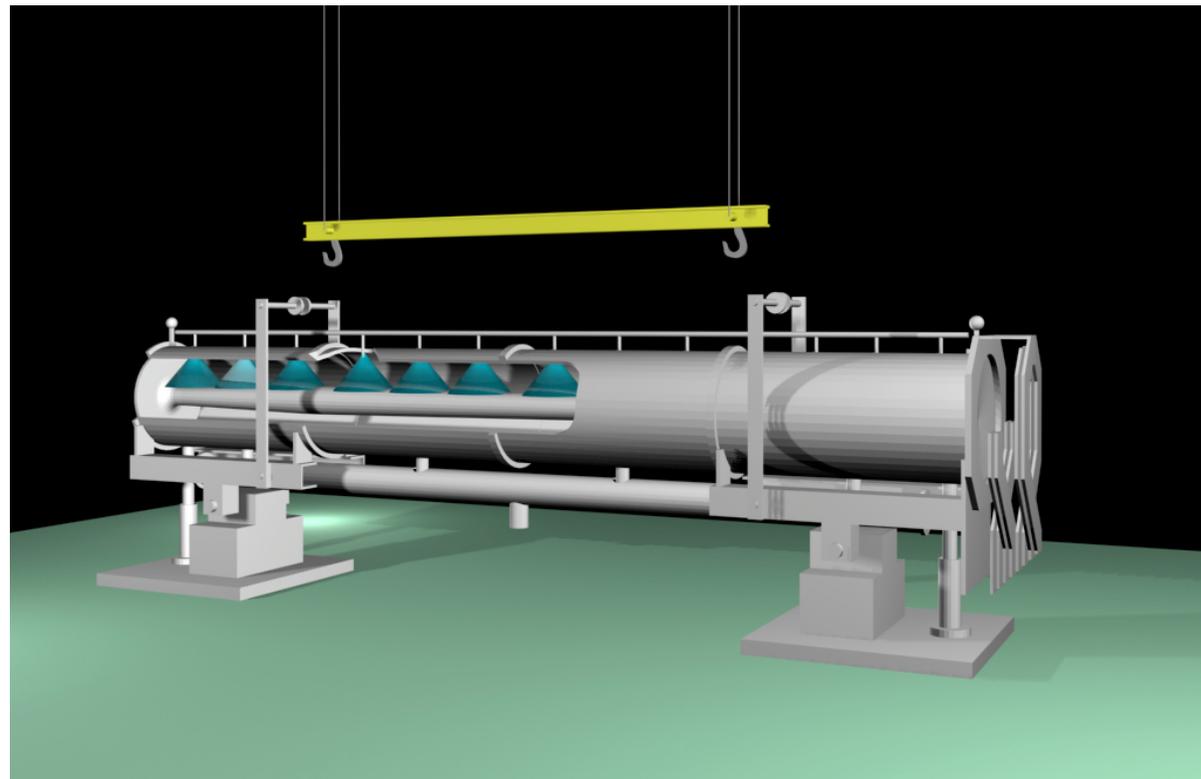

"Magnetic Horn" (S. v.der Meer, CERN)

length: 6.5 m
diameter: 70 cm
weight: 1500 kg

Pulsed devices:
150kA / 180 kA, 1 ms

water-cooled:
distributed nozzles

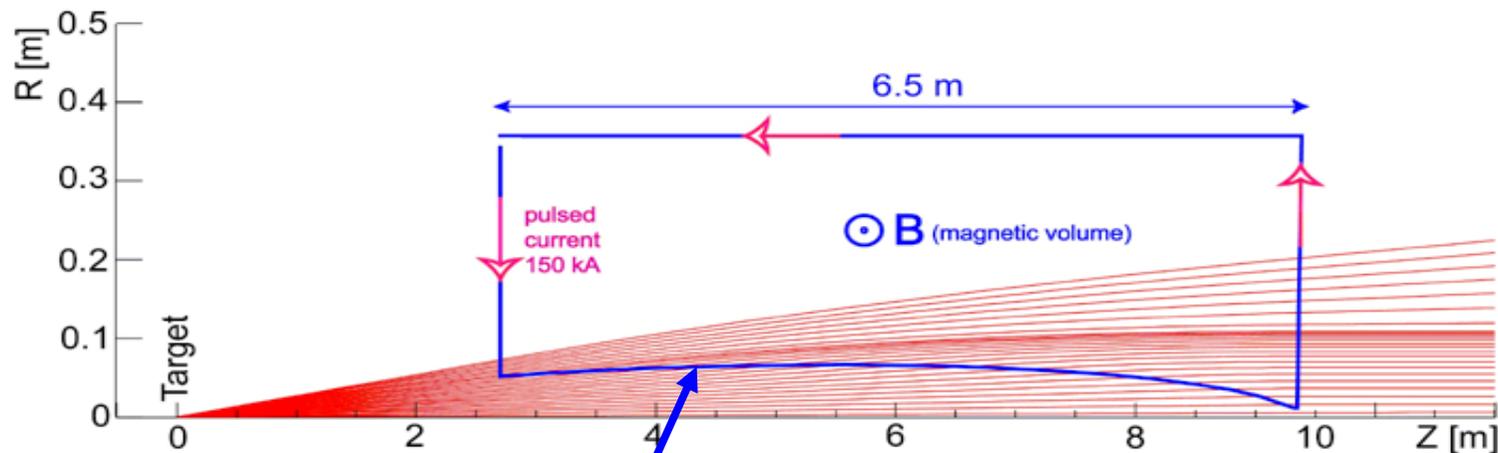

Principle of focusing with a Magnetic Horn

Magnetic volume given by "one turn" at high current:

- ◆ specially shaped inner conductor
 - end plates
- ◆ cylindrical outer conductor

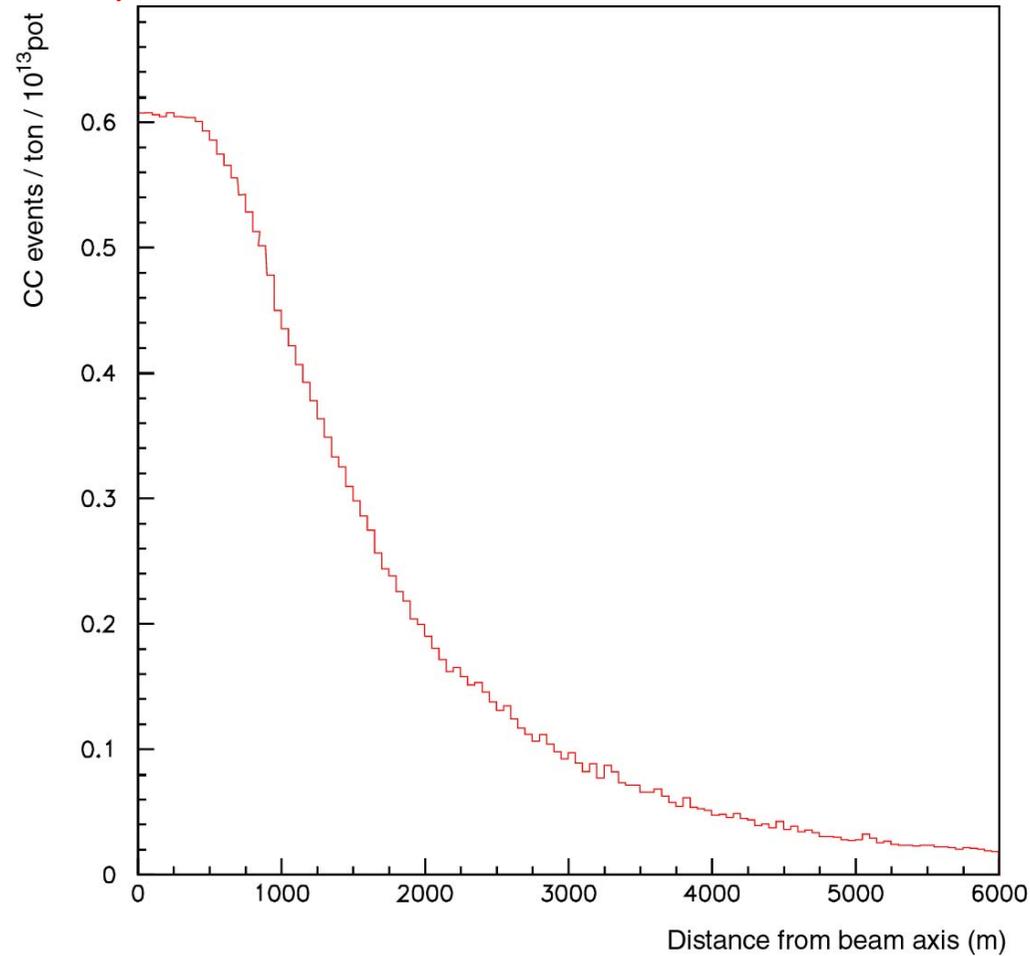

inner conductor

ECT* meeting

Radial distribution of the ν_μ - beam at Gran Sasso

ECT* meeting

Number of particles expected per year:

For 1 year of CNGS operation, we expect:

(4.8×10^{13} protons in SPS, 55% efficiency -- 1997)

protons on target

4.5×10^{19}

pions / kaons at entrance to decay tunnel

5.8×10^{19}

muons in first / second muon pit

$3.6 \times 10^{18} / 1.1 \times 10^{17}$

V_{μ} in 100 m² at Gran Sasso

3.5×10^{12}

Upgrade with a factor of 1.5 feasible but requires investment in CERN injector complex

Unwanted neutrino species

Relative to the main ν_μ component:

$$\nu_e / \nu_\mu = 0.8 \%$$

$$\text{anti-}\nu_\mu / \nu_\mu = 2.1 \%$$

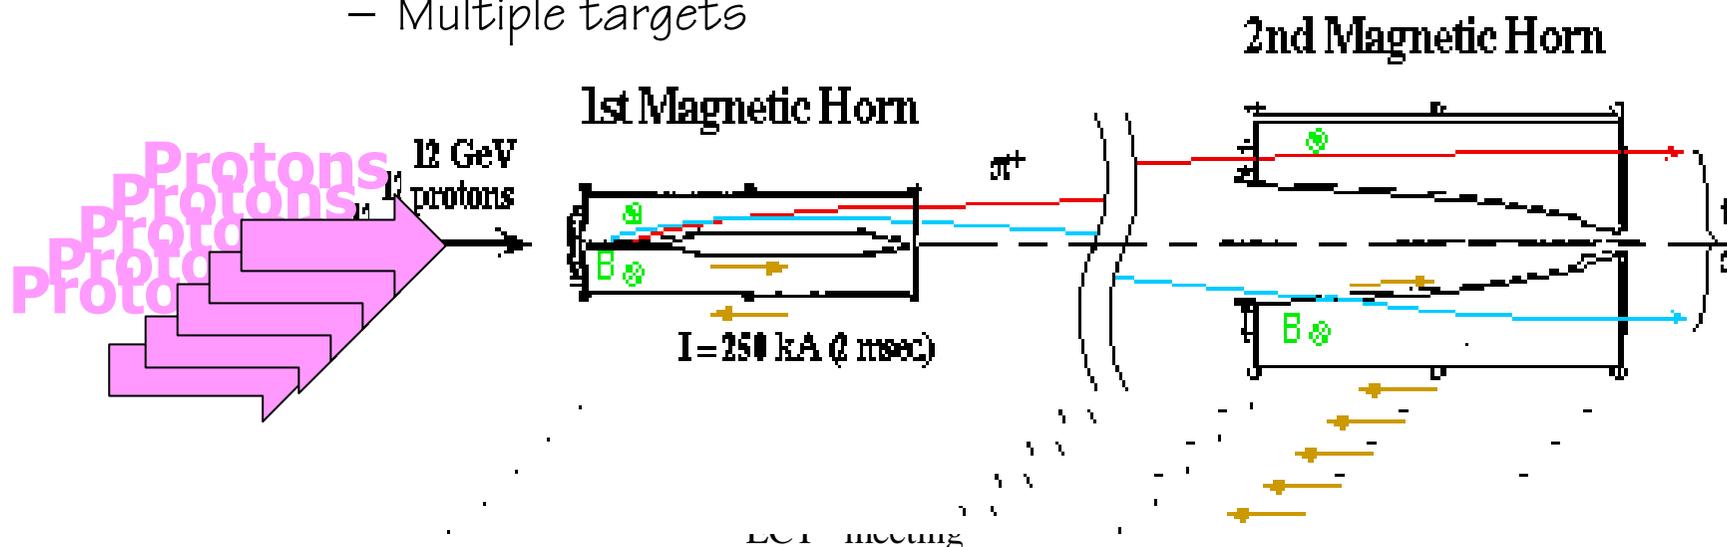

$$\text{anti-}\nu_e / \nu_\mu = 0.07 \%$$

What is the Super Neutrino Beam?

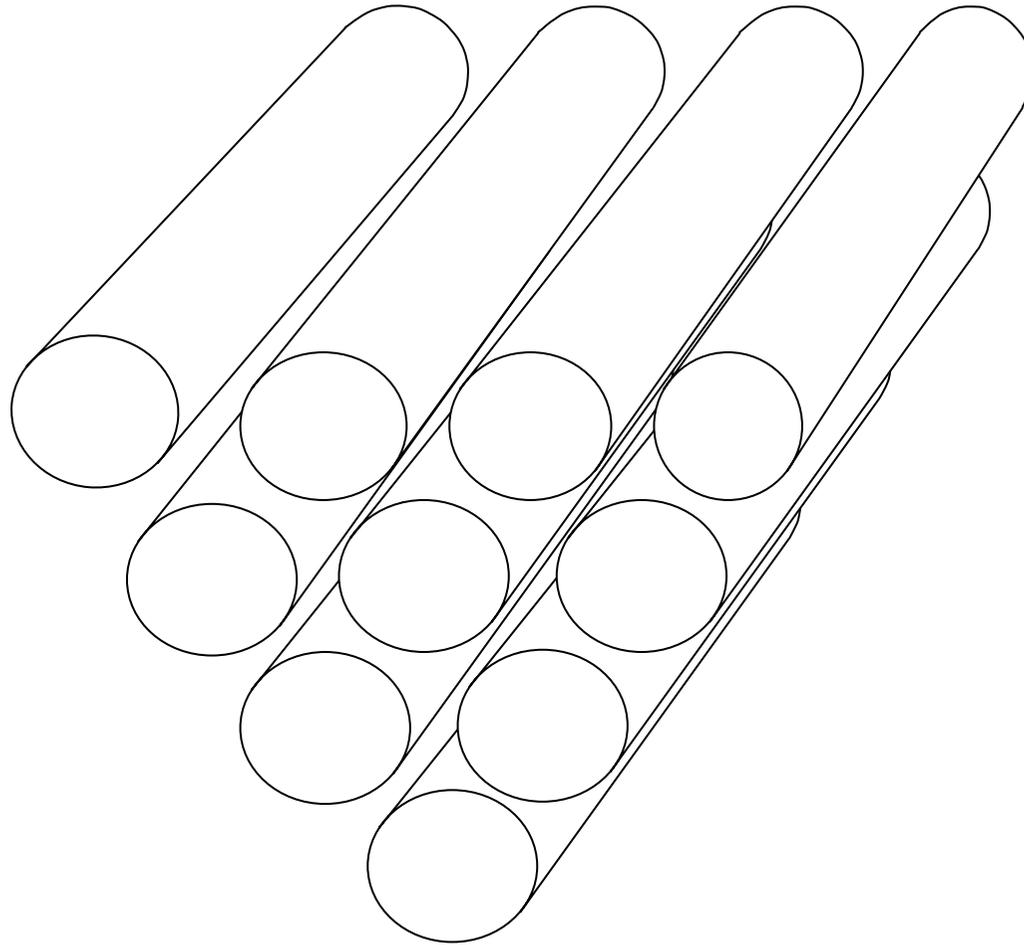

- No Clear definition, but it is a very intense neutrino beam produced by a high power ($>1\text{MW}$) accelerator.
 - A conventional method.
 - Still technically challenging due to the high power and the high radiation environment, but not impossible.
 - Multiple targets

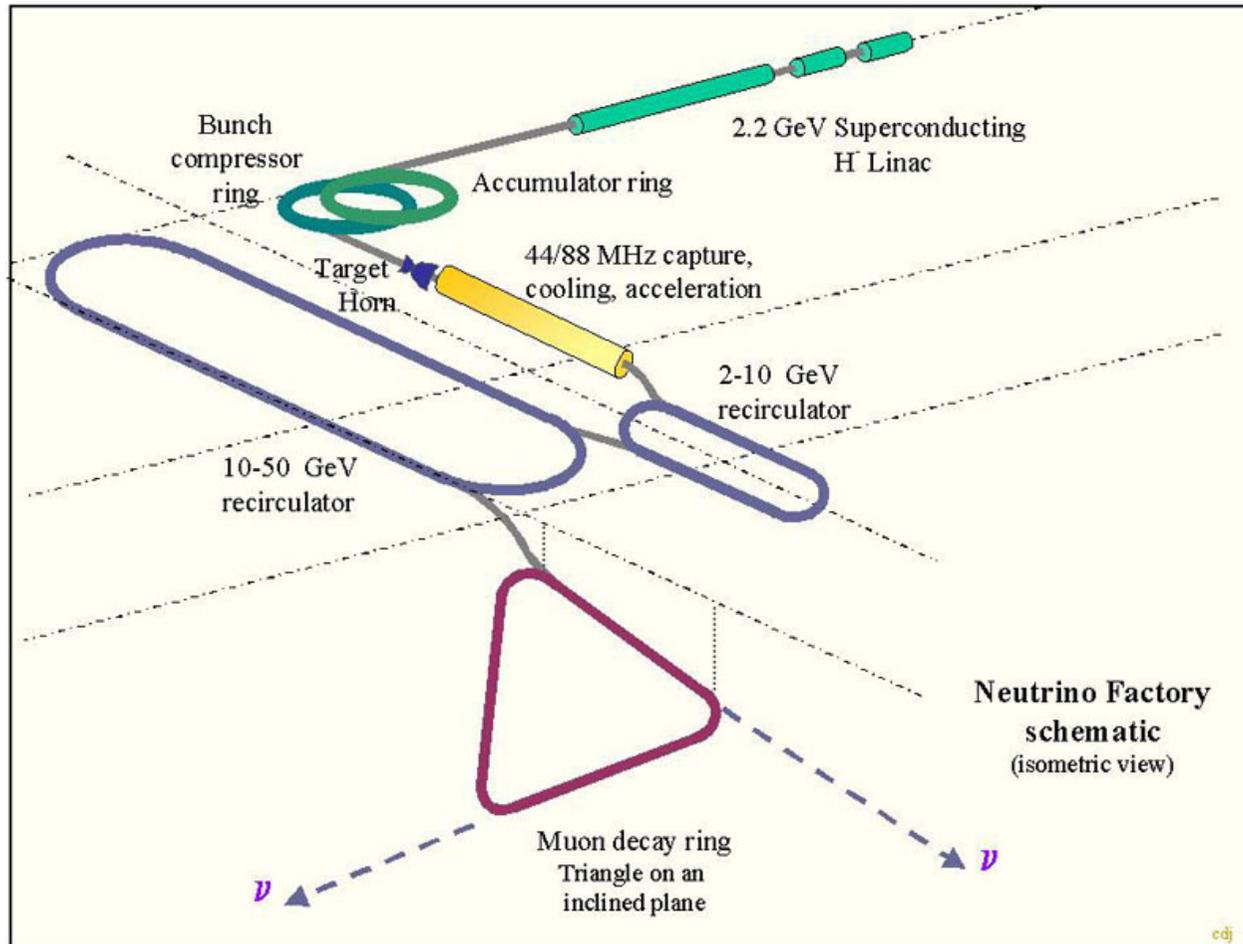

Target stack?

ECT* meeting

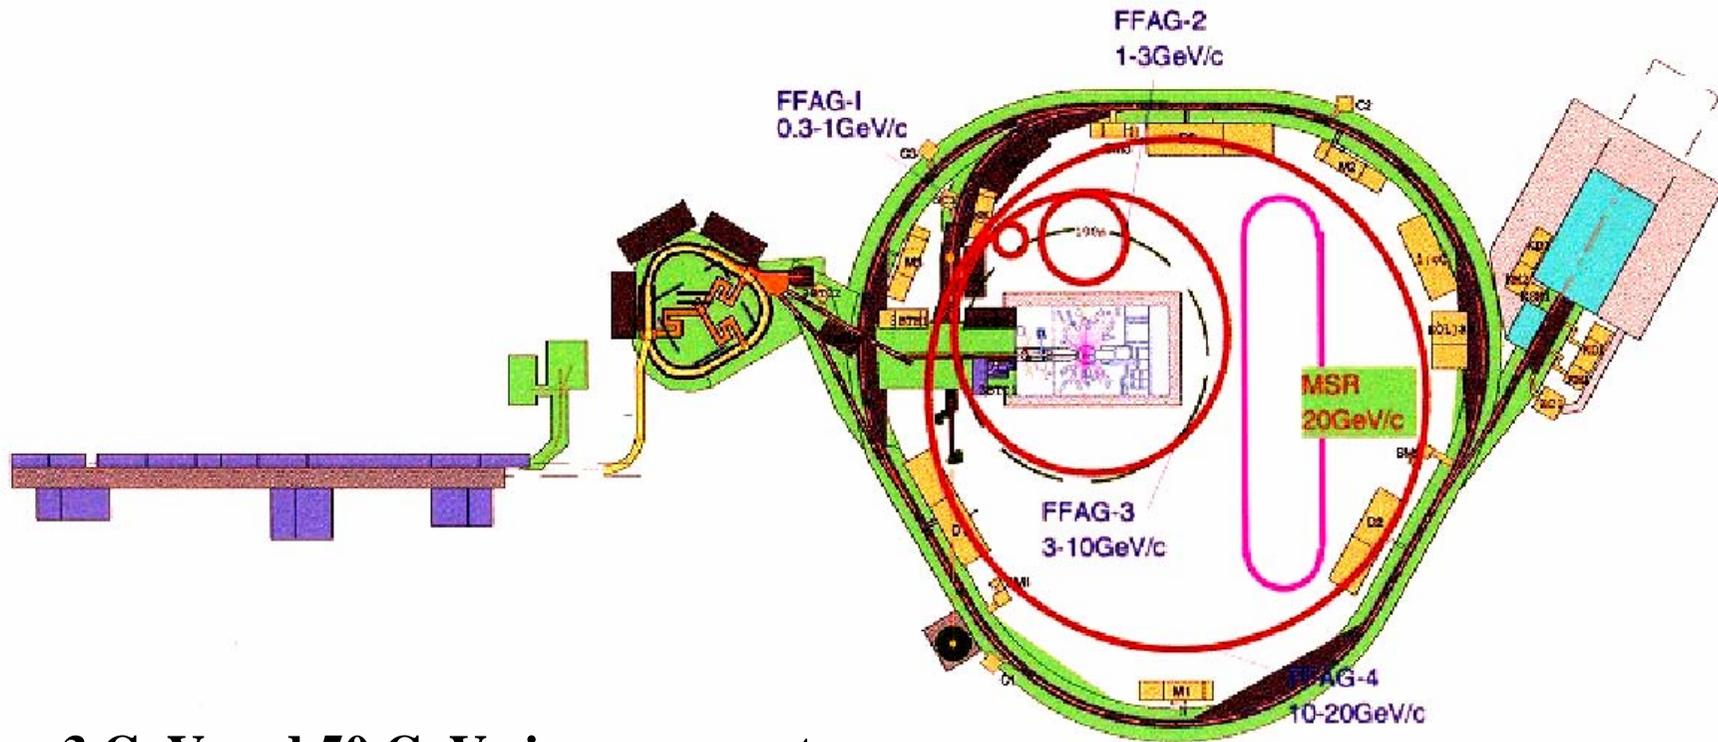

Neutrino factory CERN

- Superconducting proton linac as driver
- Proton bunch train not longer than decay ring
- Bunch to bucket philosophy
- Longitudinal cooling using bunch rotation
- Transversal cooling using ionization cooling
- Recirculating linear accelerators
- Decay ring

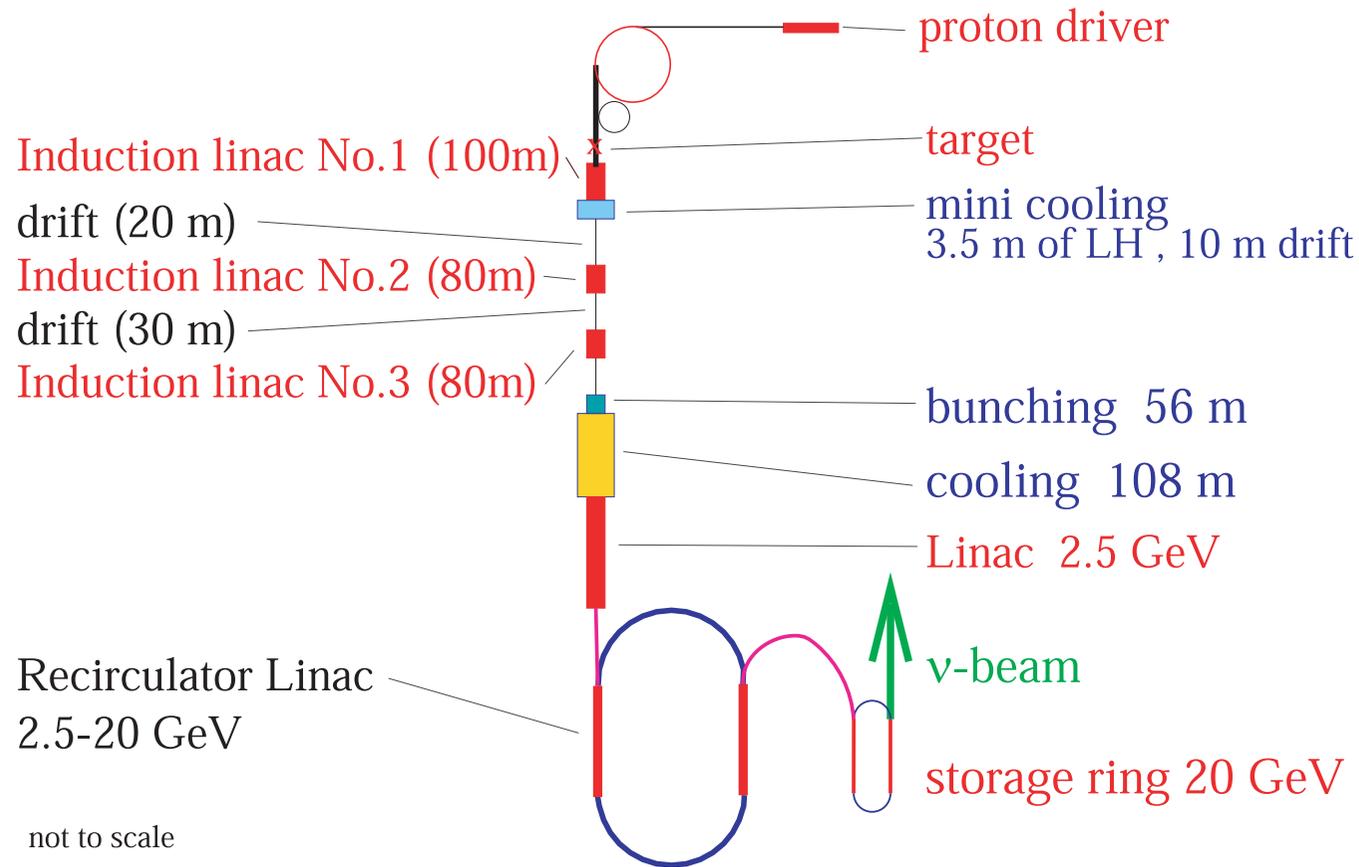

Neutrino factory Japan

**3 GeV and 50 GeV rings are part
of JAERI-KEK Joint Project**

American Study II

ECT* meeting

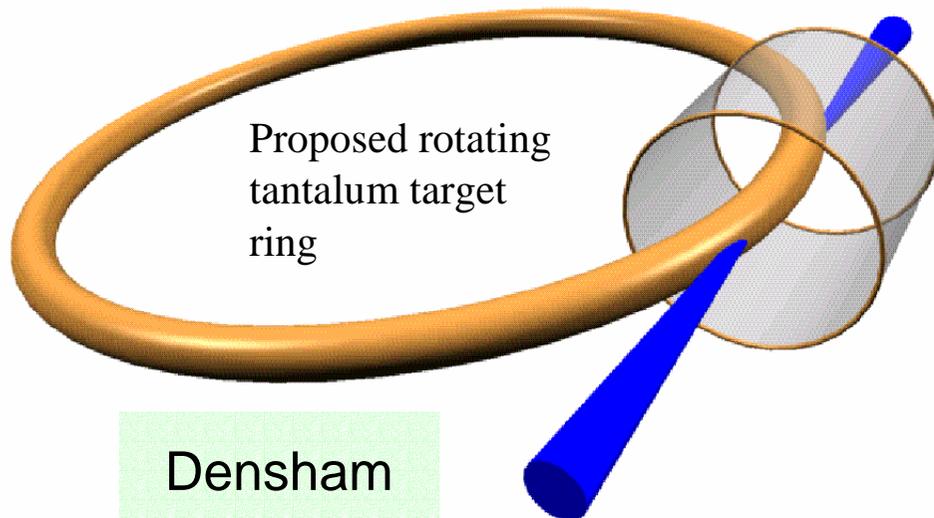

Targetry

Many difficulties: enormous power density
=> lifetime problems
pion capture

Replace target between bunches:

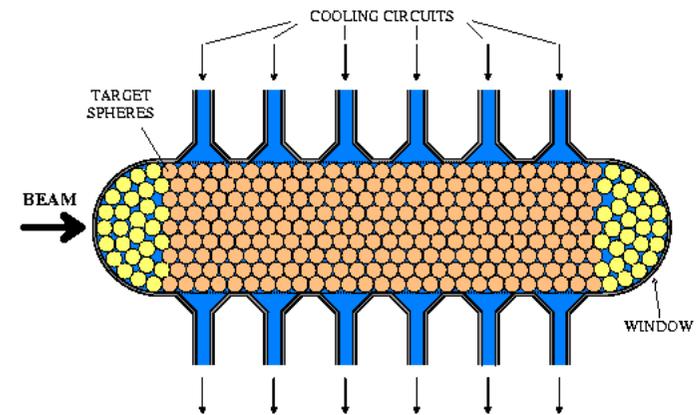

Liquid mercury jet or rotating solid target

Proposed rotating tantalum target ring

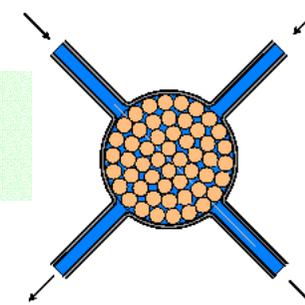

Densham

Stationary target:

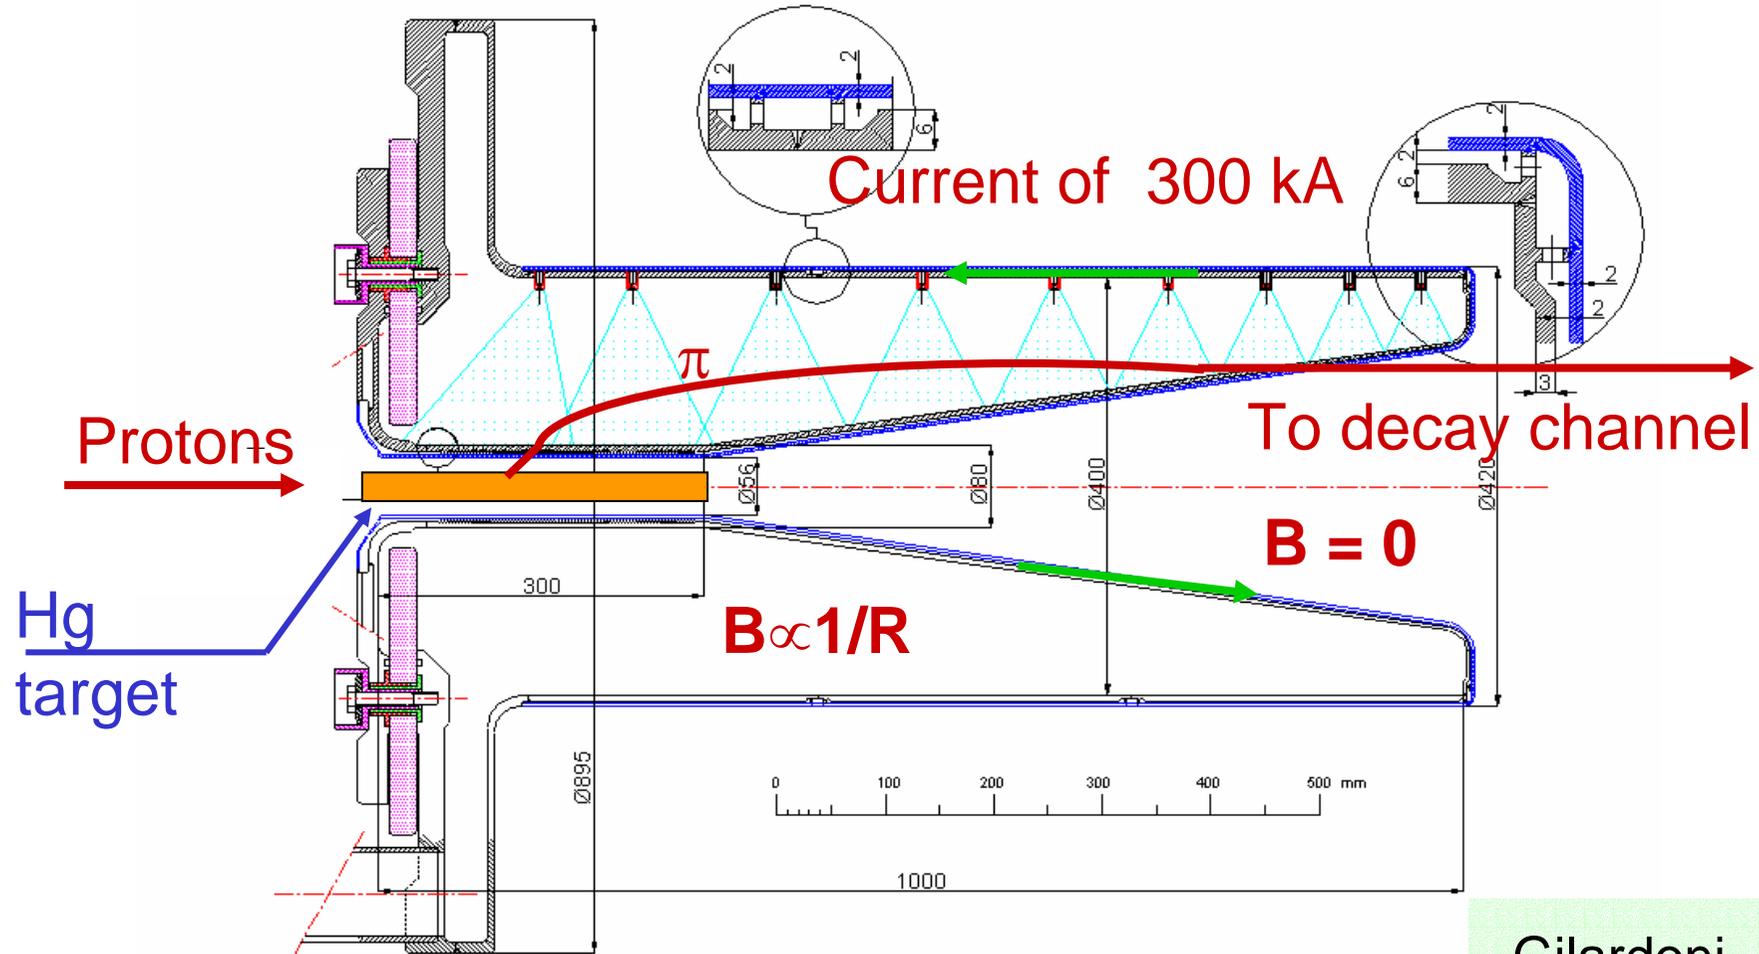

Sievers

eting

Target and pion capture liquid jet+Horn

NEUTRINO FACTORY - Horn 1 prototype
ECT* meeting

Jet test at BNL

Event #11 25th April 2001

K. Mc Donald, H. Kirk, A. Fabich, J. Lettry

Protons

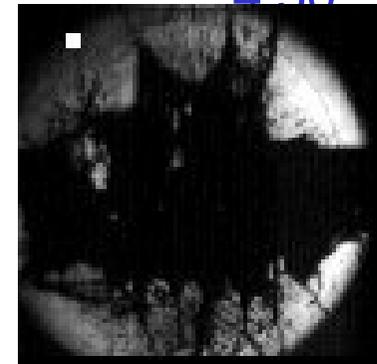

Picture timing

[ms]

0.00

0.75

4.50

P-bunch:

2.7×10^{12} ppb

100 ns

$t_0 = \sim 0.45$ ms

Hg- jet :

diameter 1.2 cm

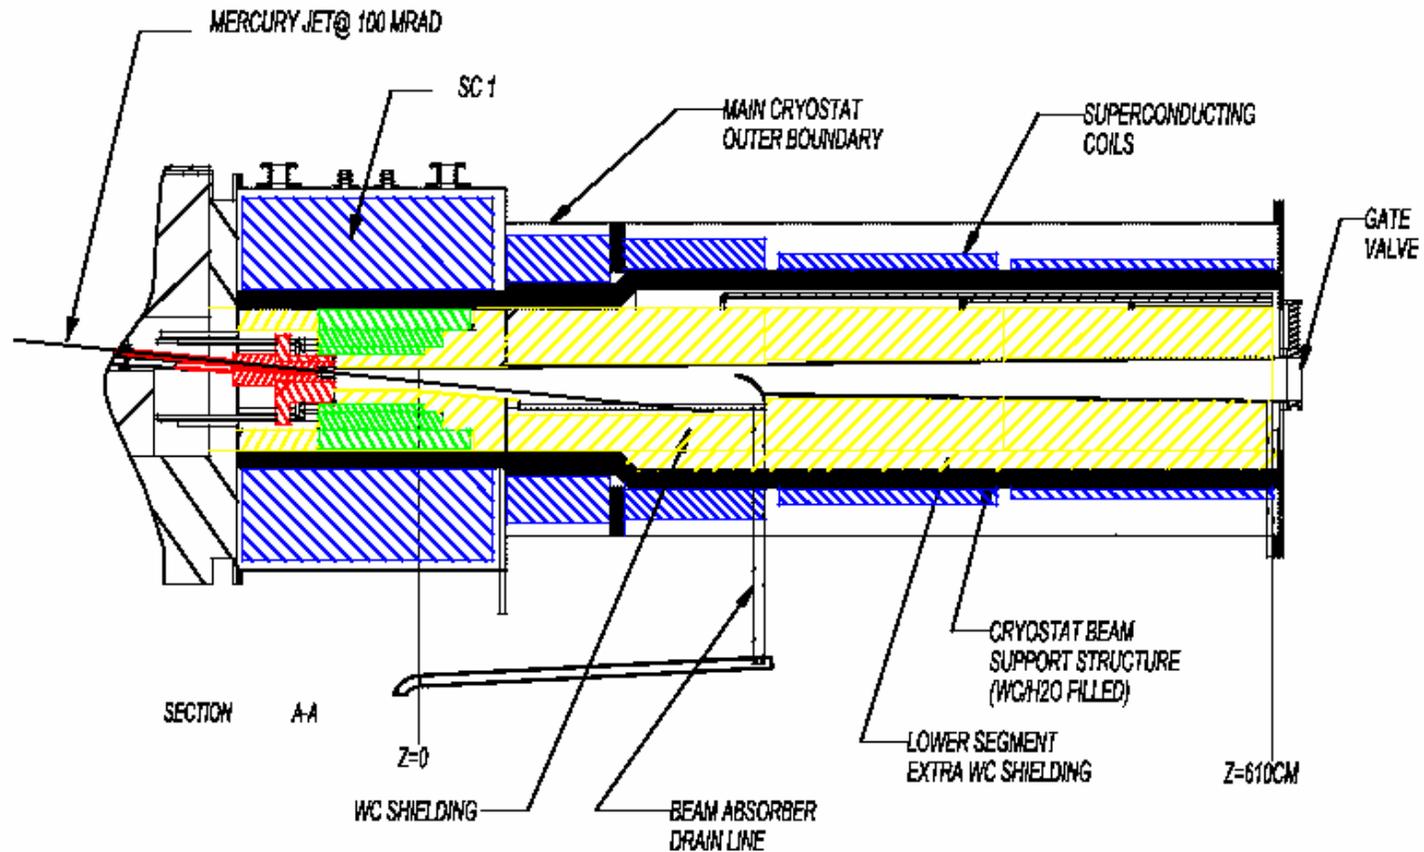

jet-velocity 2.5 m/s

perp. velocity ~ 5 m/s

ECT* meeting

Pion Capture: Solenoid

20T

1.25T

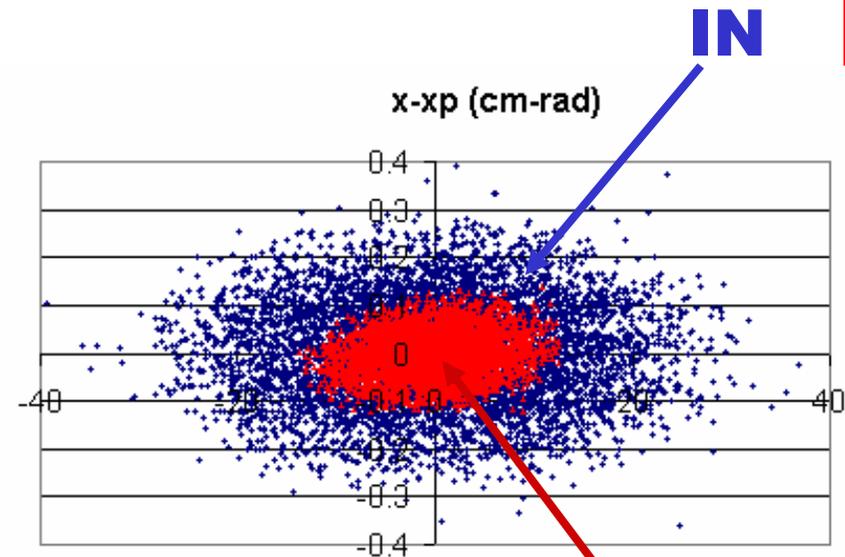

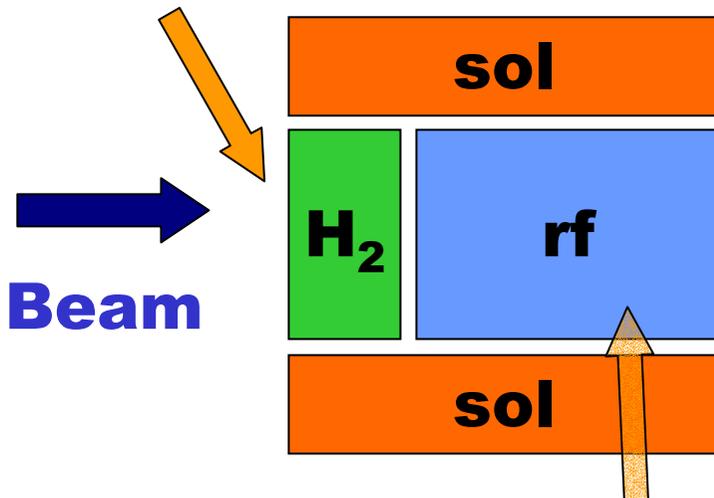

ECT* meeting

Ionization cooling

Liquid H₂: dE/dx

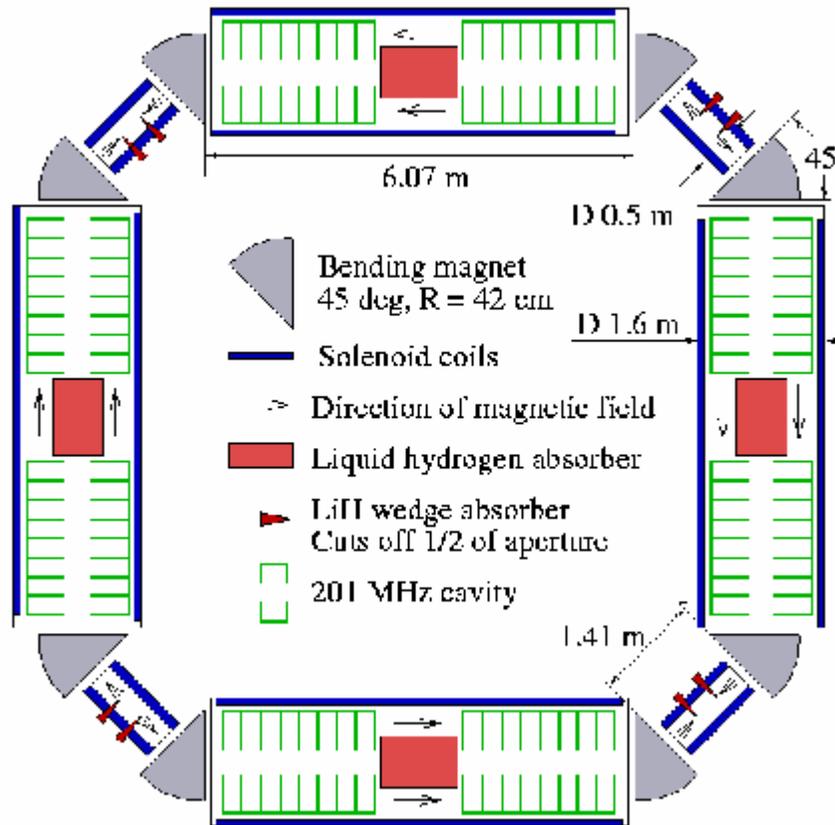

RF restores only $P_{||}$: E constant

ECT* meeting

OUT

Cooling - rings

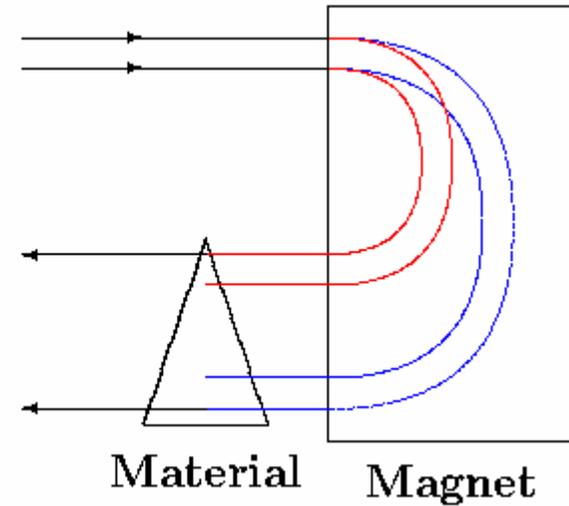

Balbekov

Main advantages:
shorter
longitudinal cooling

High dp/p
Low ϵ_n

Low dp/p
High ϵ_n

Palmer

Comparison of General Layout

| System | CERN | FNAL (Study I) | BNL (Study II) | Japanese |
|--------------------|--------------------|--------------------|--------------------|----------------------------|
| System rep rate | 50 Hz | | 2.5/5 Hz | |
| Proton driver type | Linac (SPL) | Synchrotron | Synchrotron (AGS) | Synchrotron |
| p driver energy | 2.2 GeV | 16 GeV | 24 GeV | 50 GeV |
| Target material | Hg | C | C | |
| Collection | Horn | Solenoid | Solenoid | |
| Beam structure | Bunch-to-bucket | Re-bunching | Re-bunching | |
| Phase rotation | rf | 2 induction linacs | 3 induction linacs | FFAG |
| Cooling channel | 88 MHz | 200 MHz | 200 MHz | No cooling |
| Acceleration | 2 RLAs (20/50 GeV) | 2 RLAs (20/50 GeV) | 1 RLA (20 GeV) | 4 FFAGs (1/3/10/20-50 GeV) |

ECT* meeting

The beta-beam

- Synergies between several physics communities
 - Neutrino physics
 - Nuclear structure
 - EURISOL
 - Low energy neutrinos (C. Volpe)
 - Astrophysics
- A baseline scenario that could be built today:
 - Use known technology (or reasonable extrapolations of known technology)
 - Use innovations to increase the performance
 - Re-use a maximum of the existing accelerators

CERN: β -beam baseline scenario

Nuclear Physics

SPL

ISOL target & Ion source

ECR

Cyclotrons, linac or FFAG

Rapid cycling synchrotron

PS

SPS

Decay Ring

Decay ring

$B\rho_0 = 1500 \text{ Tm}$

$B = 5 \text{ T}$

$L_{ss} = 2500 \text{ m}$

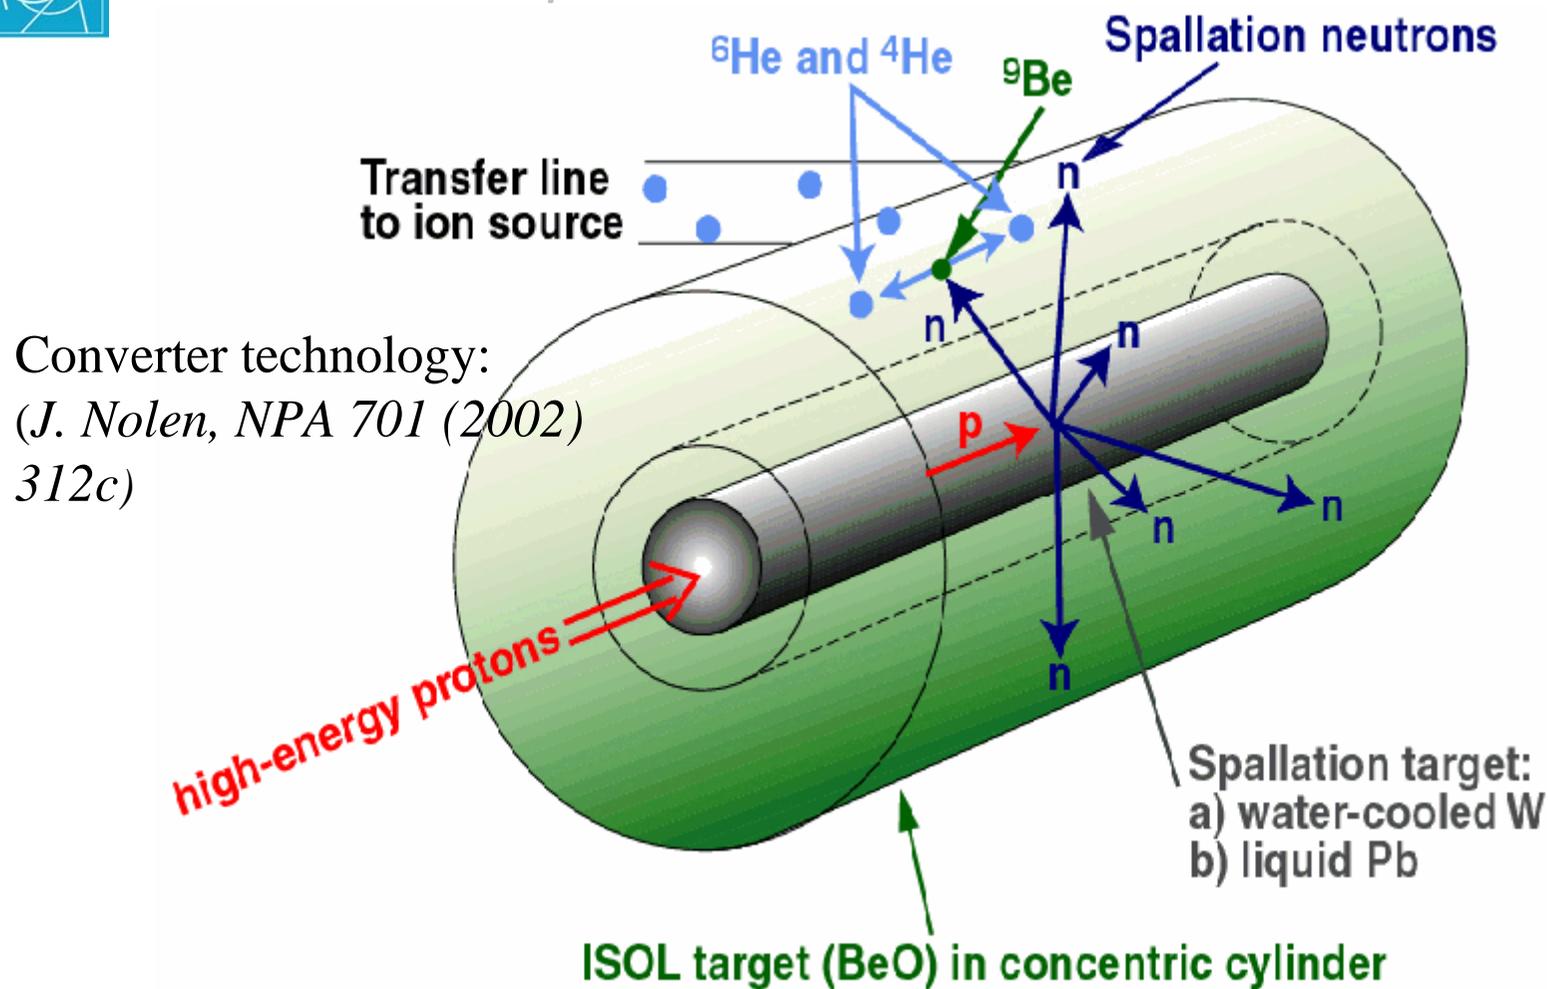

Average $E_{cms} = 1.937 \text{ MeV}$

Average $E_{cms} = 1.86 \text{ MeV}$

${}^6\text{He}$ production by ${}^9\text{Be}(n,\alpha)$

Converter technology:
(J. Nolen, NPA 701 (2002)
312c)

Layout very similar to planned EURISOL converter target
aiming for 10^{15} fissions per s.

Production of β^+ emitters

Scenario 1

- Spallation of close-by target nuclides:

$^{18,19}\text{Ne}$ from MgO and $^{34,35}\text{Ar}$ in CaO

- Production rate for ^{18}Ne is $1 \times 10^{12} \text{ s}^{-1}$ (with 2.2 GeV 100 μA proton beam, cross-sections of some mb and a 1 m long oxide target of 10% theoretical density)
- ^{19}Ne can be produced with one order of magnitude higher intensity but the half life is 17 seconds!

Scenario 2

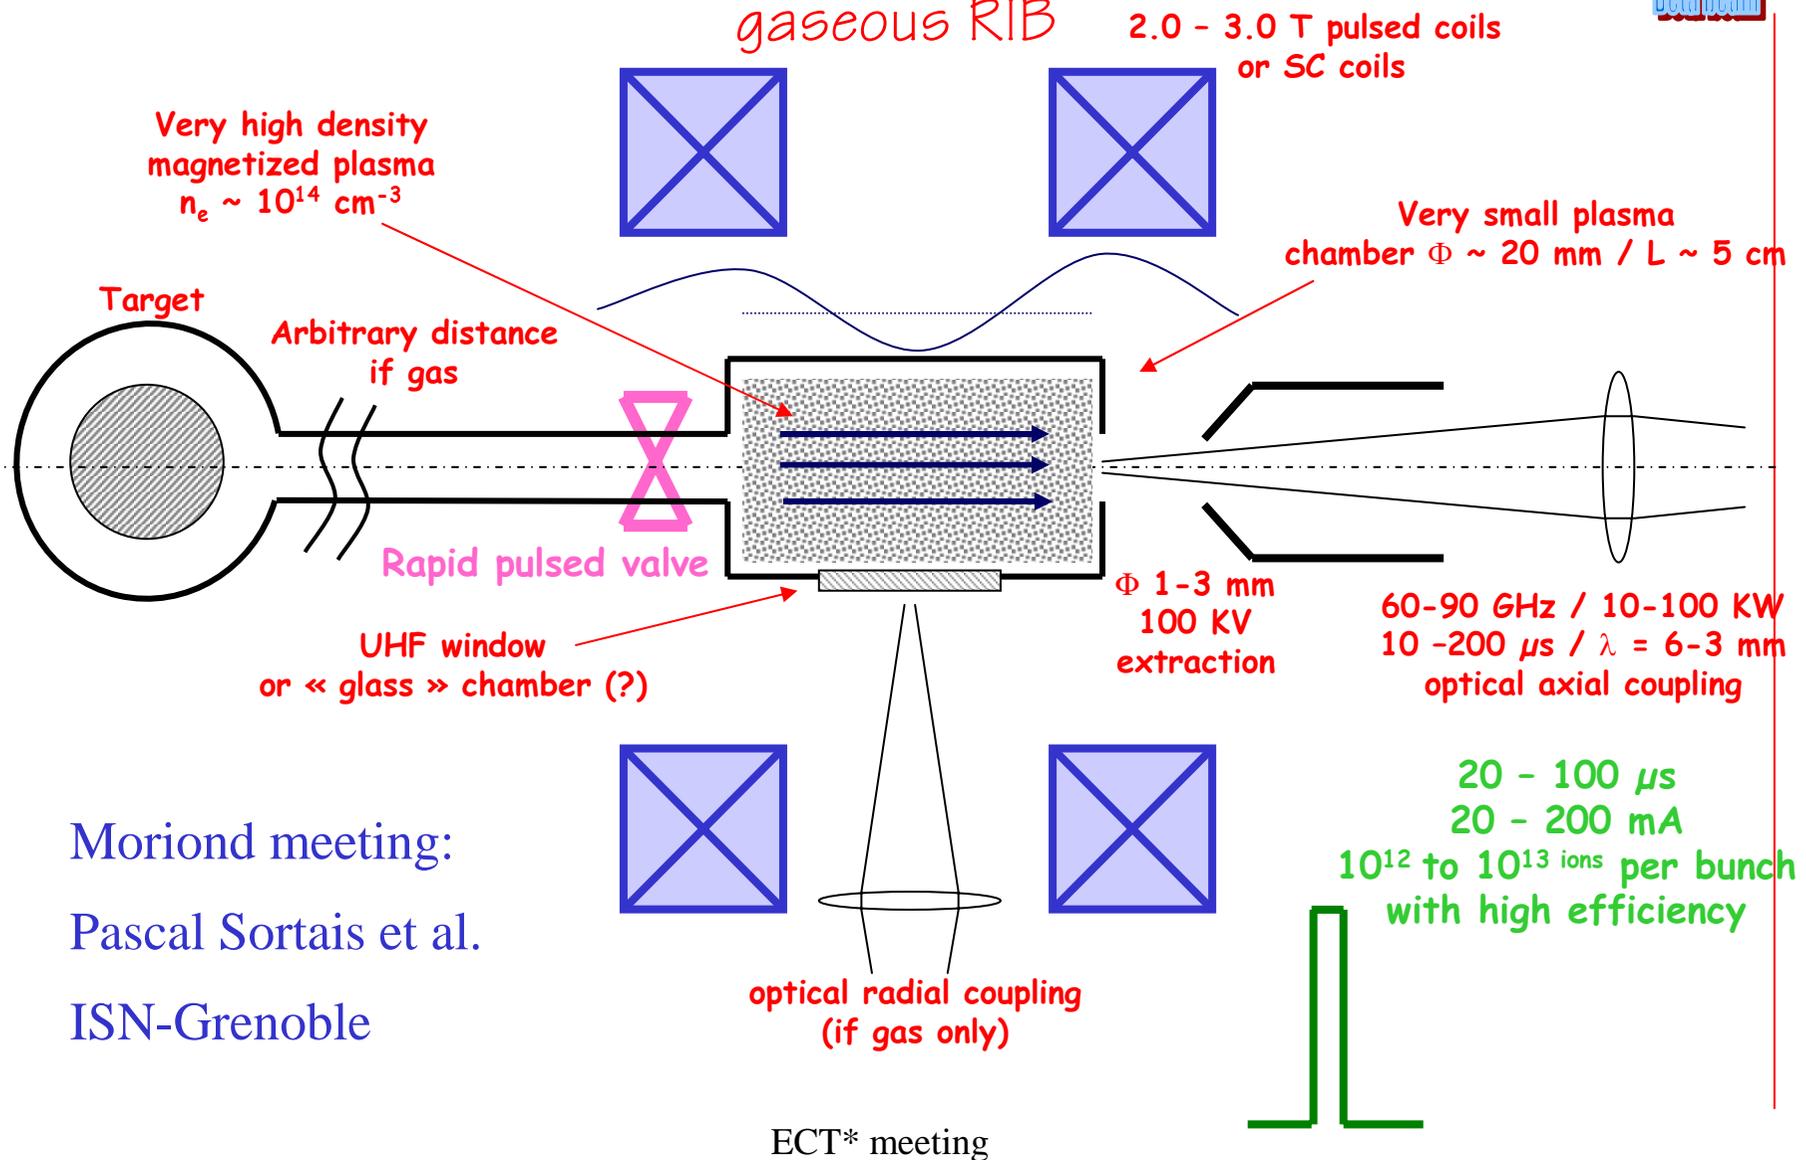

- alternatively use (α, n) and $(^3\text{He}, n)$ reactions:

$^{12}\text{C}(^3\text{He}, n)^{14,15}\text{O}$, $^{16}\text{O}(^3\text{He}, n)^{18,19}\text{Ne}$, $^{32}\text{S}(^3\text{He}, n)^{34,35}\text{Ar}$

- Intense ^3He beams of 10-100 mA 50 MeV are required

60-90 GHz « ECR Duoplasmatron » for gaseous RIB

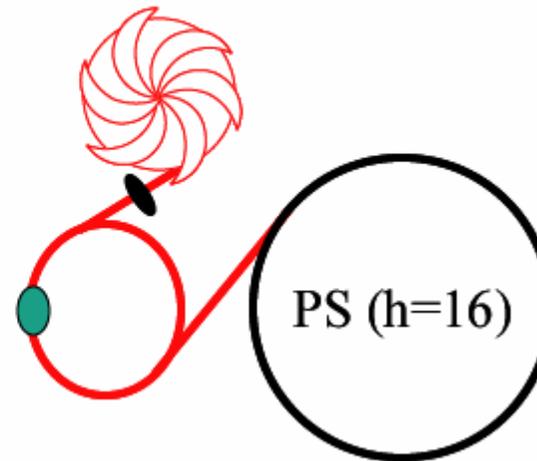

Moriond meeting:
Pascal Sortais et al.
ISN-Grenoble

Overview: Accumulation

Cyclotron (or FFAG)

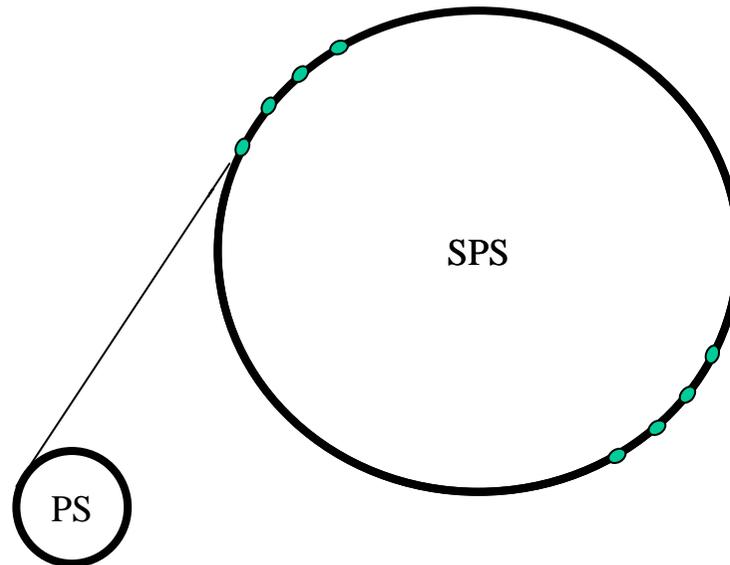

Accumulator ring ($h=1$)

- Sequential filling of 16 buckets in the PS from the storage ring

Overview: PS to SPS

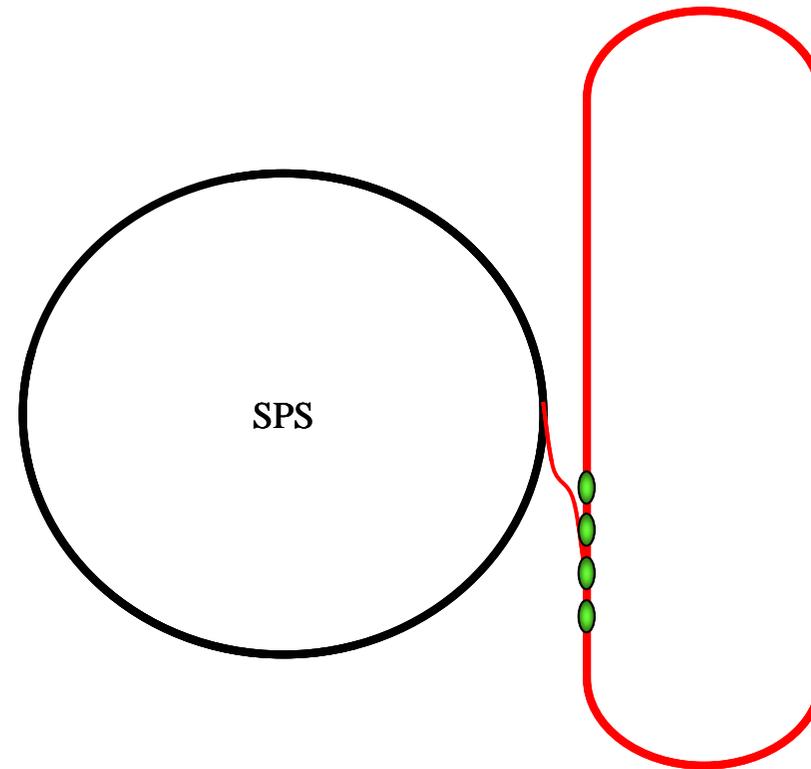

- Merging in PS to 8 buckets
- Blow-up before transfer to manage space charge limit in SPS

Overview: Decay ring

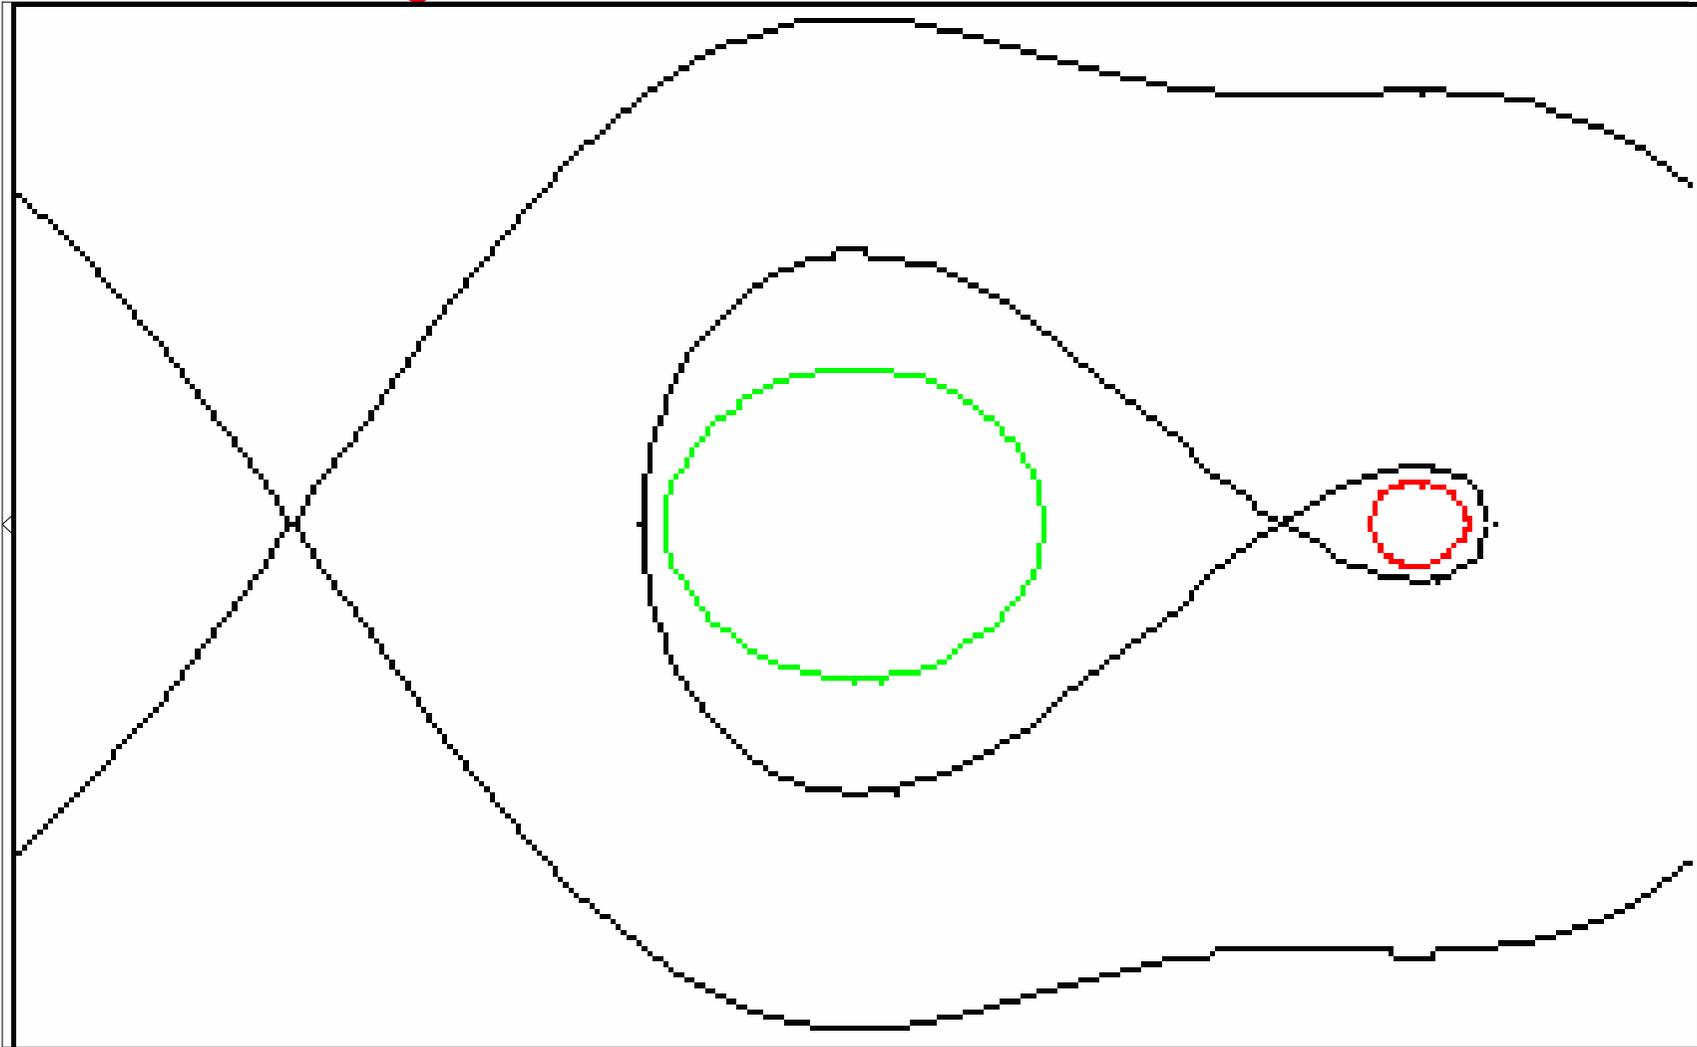

- Ejection to matched dispersion trajectory
- Asymmetric bunch merging

Injection to decay ring

ECT* meeting

M. Benedikt

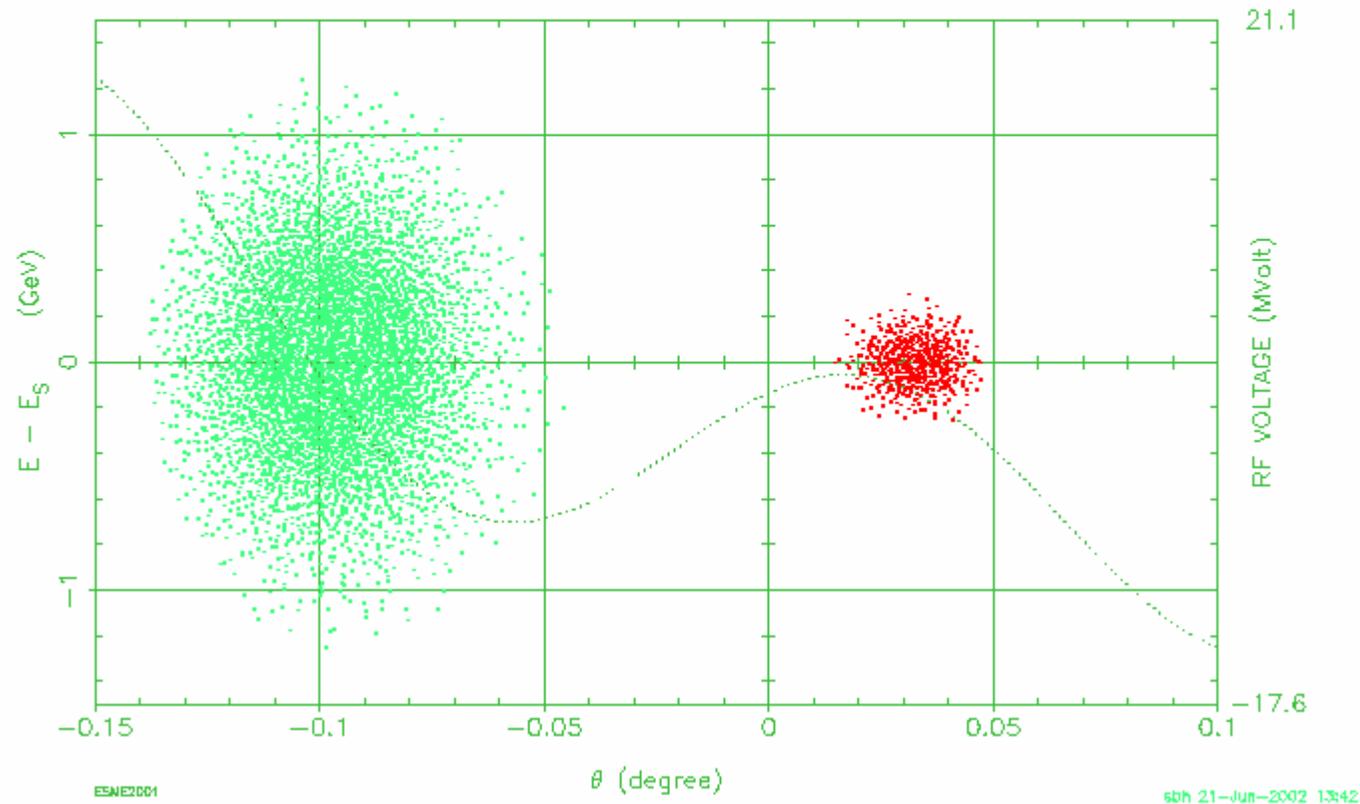

Asymmetric bunch merging

BUNCH PAIR MERGING IN THE SPS

| | | Iter | 0 | 0.000E+00 sec | | |
|-------------------------------|---|-------------|------|---------------|--------------|--|
| H_B (MeV) | S_B (eV s) | E_S (MeV) | h | V (MV) | ψ (deg) | |
| 1.0004E+03 | 1.3158E+01 | 8.4101E+05 | 924 | 1.000E+01 | -1.352E+02 | |
| ν_s (turn ⁻¹) | $\rho\dot{\text{dot}}$ (MeV s ⁻¹) | η | 1848 | 1.000E+01 | 4.479E+01 | |
| 2.1221E-03 | 0.0000E+00 | 1.6143E-03 | | | | |
| τ (s) | S_b (eV s) | N | | | | |
| 2.3055E-05 | 3.1515E+00 | 5500 | | | | |

Decay losses

- Acceleration losses:

| | ${}^6\text{He}$ ($T_{1/2}=0.8\text{ s}$) | ${}^{18}\text{Ne}$ ($T_{1/2}=1.67\text{ s}$) |
|--------------|---|---|
| Accumulation | <47 mW/m | <2.9 mW/m |
| PS | 1.2 W/m | 90 mW/m |
| SPS | 0.41 W/m | 32 mW/m |
| Decay ring | 8.9 W/m | 0.6 W/m |

A. Jansson

Intensities:

- ${}^6\text{He}$:
 - Decay ring: 2.0×10^{14} ions in four 10 ns long bunch
- ${}^{18}\text{Ne}$ (single target)
 - Decay ring: 9.1×10^{12} ions in four 10 ns long bunch
 - Only β -decay losses accounted for, efficiency < 50%

Moriond meeting

- Annual electro week meeting in Les Arcs
- Workshop on Radioactive beams for Nuclear and Neutrino Physics
 - Organizer: Jacques Bouchez, CEA, Saclay
- Many new ideas, among them:
 - Multiple targets for Ne production
 - ECR bunching (P. Sortais)
 - Ne and He in the decay ring simultaneously
 - Low energy beta facility (C. Volpe)
 - GSI, GANIL and CERN (in close detector)

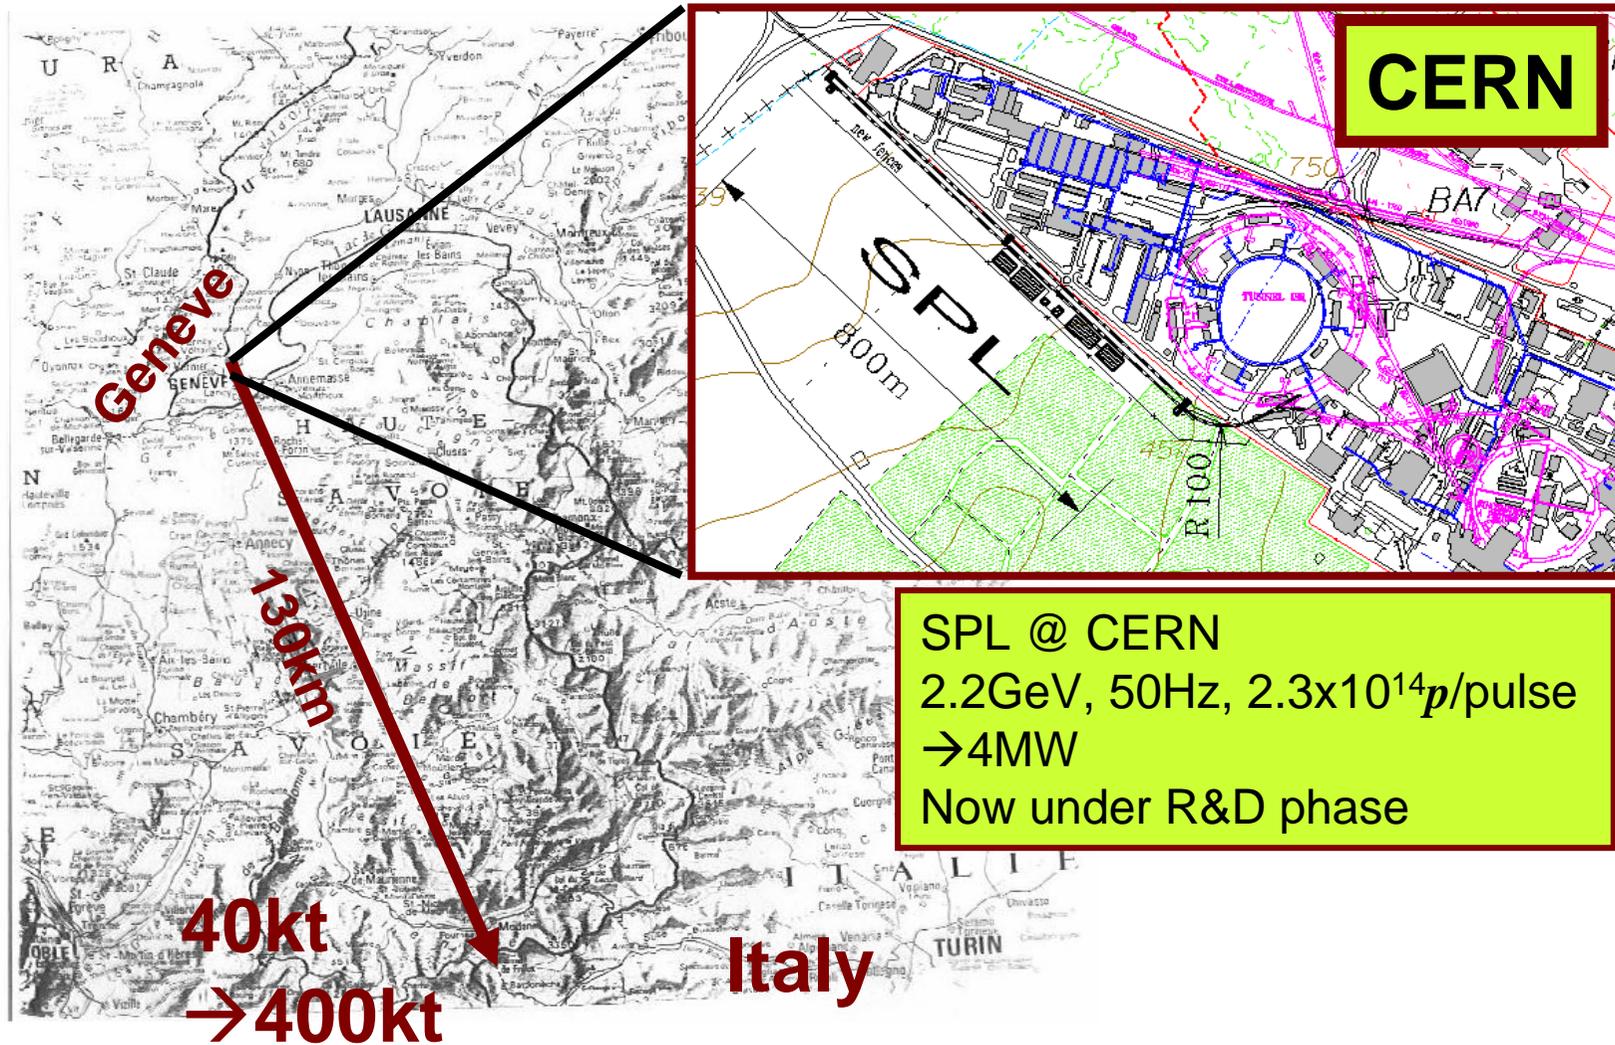

Ne and He in decay ring simultaneously

- Enormous “gain” in counting time
 - Years!
- Requiring $\gamma=150$ for He will at equal rigidity result in a $\gamma=250$ for Ne
 - Physics?
 - Detector simulation should give “best” compromise
- Requiring equal revolution time will result in a ΔR of 20 mm ($R_0=1090$ m)
 - Manageable?

CERN to FREJUS

ECT* meeting

Neutron beams?

- As for a neutrino beam and neutron beam can be created if a beta-delayed neutron emitter is stored in the decay ring
 - High energy
 - Physics case?
 - Low energy
 - Medical use – neutron therapy
 - Waste transmutation at neutron resonances
 - Intensity?

Comments

- The super beam can be available soon (when the necessary high power drivers are completed)
- The beta-beam is largely based on existing technology but requires costly civil engineering for the decay ring
 - Moderate extrapolations on target technology
 - Strong synergies with projects in nuclear physics
 - EURISOL
 - GSI upgrade
 - SPIRAL-2
 - SPES in Legnaro
 - Ion programme in LHC and low energy ion (accelerator and) storage rings in Europe
 - Low energy beta-beam facility (C. Volpe)
- The R&D for a full scale muon based neutrino factory is fascinating but very challenging
 - Target issues still requires major R&D
 - Ionization cooling has to be experimentally tested
